

Customized Q235 Metal Protector Platform Portal Frame Scaffolding System for Construction

Our Product Introduction

for more products please visit us on bythaiscaffold.com

Basic Information

- Place of Origin: China
- Brand Name: Bythai
- Certification: SGS ISO
- Model Number: BT205
- Minimum Order Quantity: 1000
- Price: 10.5-35.5
- Packaging Details: In bundles
- Delivery Time: 10-15
- Payment Terms: TT/TC

Product Specification

- Color: Steel/Spray Plastic
- Material: Q235
- Shipping Origin: China
- Load Capacity: High
- Size: Customized
- Arrival Time: 10-15
- Highlight: Construction Portal Frame Scaffolding System, Q235 Portal Frame Scaffolding System, Customized Q235 Metal Protector Platform

Product Description:

The shipping origin of our frame scaffolding system is China, a global manufacturing hub known for its capacity to produce high-quality goods efficiently. By sourcing our products from China, we are able to offer competitive pricing without compromising on the quality or performance of our scaffolding systems. Additionally, with our logistics expertise, we ensure that the products are delivered to your site in a timely and secure manner, regardless of your location.

One of the most critical attributes of our frame scaffolding system is its high load capacity. The product is made from Q235 material, which is a grade of steel known for its strength and structural integrity. This means that our scaffolding system can support significant weight, making it suitable for heavy-duty applications where safety and stability are paramount. The high load capacity assures that workers can perform their tasks with confidence, knowing that the scaffolding will remain steadfast under various load conditions.

Moreover, the Portal Frame Scaffold Erection is designed for quick and easy setup, which saves valuable time on the job site. The portal frame design provides a wide area of support and is ideal for projects requiring extensive scaffolding, as it allows for the creation of large, continuous structures without compromising stability. This design feature not only enhances the functionality of the scaffolding but also contributes to the efficiency of the construction process.

The h frame component of our scaffolding system is another key feature that enhances its overall performance. The h frame is recognized for its ability to provide a secure foundation and for its role in creating a modular and scalable scaffolding solution. The h frame's design contributes to the rigidity and resilience of the scaffolding structure, ensuring that it can withstand the demands of various work environments and weather conditions.

In summary, our Frame System Scaffolding product is a superior choice for professionals in the construction and building maintenance sectors. Its steel/spray plastic color, customizable size, high load capacity, and robust Q235 material construction make it a reliable and efficient solution for a wide range of scaffolding needs. With its origins in China, the product benefits from high-quality manufacturing and competitive pricing. The integration of the Portal Frame Scaffold Erection and h frame design further accentuates its convenience and safety features, making it one of the most sought-after scaffolding systems in the market. Choose our frame scaffolding system for an investment in safety, reliability, and efficiency for your next construction project.

Technical Parameters:

Attribute	Details
Material	Q235
Load Capacity	High
Shipping Origin	China
Arrival Time	10-15 days
Color	Steel/Spray Plastic
Size	Customized
